

NEWT Managed

NEWT Managed PBX is the only end-to-end managed service that operates over its own private network.

NEWT Managed PBX Business Phone System is an end-to-end, low risk voice solution operating over the proprietary Fibernetics CLEC network. Business calls traverse our private network, not the public Internet, thus ensuring optimal call quality and security, while providing a service that businesses can depend upon. This managed solution allows the NEWT PBX the supervision of the call path from start to finish, allowing for quick diagnosis and resolution of voice network issues should they arise.

NEWT Managed PBX is a hybrid of hosted and premise based PBX technologies, overcoming their limits and leveraging their advantages. Everyone has experienced the unpredictable nature of the Internet, from delays in email delivery to slow loading websites. When a competing phone solution uses the Internet as part of the call path, it is impossible to manage the call quality from end to end.

Premise based systems also require ongoing maintenance, complex system set-ups and require traditional costly phone lines.

NEWT Managed PBX has simplified the system set-up and installation, eliminated the cost of business phone lines, and guarantees optimal Quality of Service. Over 20,000 Canadians count on the NEWT Managed PBX Business Phone System and benefit from its reliability, call quality, extensive feature set and flexibility.

Combined, these result in the NEWT Managed PBX low risk end-to-end solution.

“The Fibernetics experience was smooth from the beginning.”
